Lecture # 8

Recall: Properties of Probability Mass Functions

If p(x) is the pmf of a random variable X, then

(i)
$$0 \le p(x) \le 1$$
 for all x

(ii)
$$\sum_{\mathsf{all} \ x} p(x) = 1$$

where "all x" is shorthand for "all x in the support of X."

Cumulative Distribution Function (CDF)

This Def. is the same for continuous RVs.

The CDF gives the probability that a RV X does not exceed a specified threshold x_0 , as a function of x_0

$$F(x_0) = P(X \le x_0)$$

Important!

The threshold x_0 is allowed to be any real number. In particular, it doesn't have to be in the support of X!

Discrete RVs: Sum the pmf to get the CDF

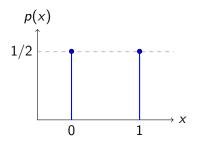

$$F(x_0) = \sum_{x \le x_0} p(x)$$

Why?

The events $\{X = x\}$ are mutually exclusive, so we sum to get the probability of their union for all $x \le x_0$:

$$F(x_0) = P(X \le x_0) = P\left(\bigcup_{x \le x_0} \{X = x\}\right) = \sum_{x \le x_0} P(X = x) = \sum_{x \le x_0} p(x)$$

Probability Mass Function

$$p(0) = 1/2$$

 $p(1) = 1/2$

Cumulative Dist. Function

$$F(x_0) = \begin{cases} 0, & x_0 < 0 \\ \frac{1}{2}, & 0 \le x_0 < 1 \\ 1, & x_0 \ge 1 \end{cases}$$

Properties of CDFs

These are also true for continuous RVs.

- 1. $\lim_{x_0 \to \infty} F(x_0) = 1$
- 2. $\lim_{x_0 \to -\infty} F(x_0) = 0$
- 3. Non-decreasing: $x_0 < x_1 \Rightarrow F(x_0) \le F(x_1)$
- 4. Right-continuous ("open" versus "closed" on prev. slide)

Since
$$F(x_0) = P(X \le x_0)$$
, we have $0 \le F(x_0) \le 1$ for all x_0

Bernoulli Random Variable - Generalization of Coin Flip

Support Set

 $\{0,1\}-1$ traditionally called "success," 0 "failure"

Probability Mass Function

$$p(0) = 1 - p$$

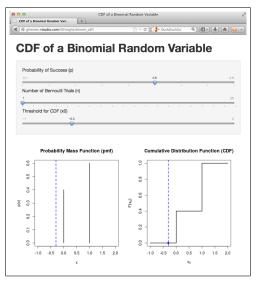

$$p(1) = p$$

Cumulative Distribution Function

$$F(x_0) = \left\{ egin{array}{ll} 0, & x_0 < 0 \ 1 - p, & 0 \leq x_0 < 1 \ 1, & x_0 \geq 1 \end{array}
ight.$$

http://fditraglia.shinyapps.io/binom_cdf/

Set the second slider to 1 and play around with the others.

Average Winnings Per Trial

If the realizations of the coin-flip RV were payoffs, how much would you expect to win per play *on average* in a long sequence of plays?

$$X = \left\{ egin{array}{l} \$0, \mathsf{Tails} \ \$1, \mathsf{Heads} \end{array}
ight.$$

Expected Value (aka Expectation)

The expected value of a discrete RV X is given by

$$E[X] = \sum_{\mathsf{all}\,x} x \cdot p(x)$$

In other words, the expected value of a discrete RV is the probability-weighted average of its realizations.

Notation

We sometimes write μ as shorthand for E[X].

Expected Value of Bernoulli RV

$$X = \begin{cases} 0, \text{Failure: } 1 - p \\ 1, \text{Success: } p \end{cases}$$

$$\sum_{\mathsf{all}\,x} x \cdot p(x) = 0 \cdot (1 - p) + 1 \cdot p = p$$

Your Turn to Caculate an Expected Value

Let X be a random variable with support set $\{1, 2, 3\}$ where p(1) = p(2) = 1/3. Calculate E[X].

Your Turn to Caculate an Expected Value

Let X be a random variable with support set $\{1, 2, 3\}$ where p(1) = p(2) = 1/3. Calculate E[X].

$$E[X] = \sum_{\text{all } x} x \cdot p(x) = 1 \times 1/3 + 2 \times 1/3 + 3 \times 1/3 = 2$$

Random Variables and Parameters

Notation: $X \sim \text{Bernoulli}(p)$

Means X is a Bernoulli RV with P(X = 1) = p and P(X = 0) = 1 - p. The tilde is read "distributes as."

Parameter

Any constant that appears in the definition of a RV, here p.

Constants Versus Random Variables

This is a crucial distinction that students sometimes miss:

Random Variables

- ▶ Suppose X is a RV the values it takes on are random
- ▶ A function g(X) of a RV is itself a RV as we'll learn today.

Constants

- \blacktriangleright E[X] is a constant (you should convince yourself of this)
- Realizations x are constants. What is random is which realization the RV takes on.
- ▶ Parameters are constants (e.g. p for Bernoulli RV)
- Sample size n is a constant

The St. Petersburg Game

How Much Would You Pay?

How much would you be willing to pay for the right to play the following game?

Imagine a fair coin. The coin is tossed once. If it falls heads, you receive a prize of \$2 and the game stops. If not, it is tossed again. If it falls heads on the second toss, you get \$4 and the game stops. If not, it is tossed again. If it falls heads on the third toss, you get \$8 and the game stops, and so on. The game stops after the first head is thrown. If the first head is thrown on the x^{th} toss, the prize is $\$2^x$

$$x \mid 2^x \mid p(x) \mid 2^x \cdot p(x)$$

$$E[Y] = \sum_{\text{all } x} 2^x \cdot p(x) =$$

$$E[Y] = \sum_{\mathsf{all} \ x} 2^x \cdot p(x) =$$

Functions of Random Variables are Themselves Random Variables

Example: Function of Bernoulli RV

Let $Y = e^X$ where $X \sim \text{Bernoulli}(p)$

Support of Y

Example: Function of Bernoulli RV

Let
$$Y = e^X$$
 where $X \sim \text{Bernoulli}(p)$

Support of *Y*

$$\{e^0, e^1\} = \{1, e\}$$

Probability Mass Function for Y

Example: Function of Bernoulli RV

Let
$$Y = e^X$$
 where $X \sim \mathsf{Bernoulli}(p)$

Support of Y

$$\{e^0,e^1\}=\{1,e\}$$

Probability Mass Function for Y

$$p_Y(y) = \left\{ egin{array}{ll} p & y = e \ 1 - p & y = 1 \ 0 & ext{otherwise} \end{array}
ight.$$

Let
$$Y = e^X$$
 where $X \sim \mathsf{Bernoulli}(p)$

Probability Mass Function for Y

$$p_Y(y) = \left\{ egin{array}{ll} p & y = e \ 1 - p & y = 1 \ 0 & ext{otherwise} \end{array}
ight.$$

Expectation of $Y = e^X$

Let
$$Y = e^X$$
 where $X \sim \text{Bernoulli}(p)$

Probability Mass Function for Y

$$p_Y(y) = \left\{ egin{array}{ll} p & y = e \ 1 - p & y = 1 \ 0 & ext{otherwise} \end{array}
ight.$$

Expectation of $Y = e^X$

$$\sum_{y \in \{1,e\}} y \cdot p_Y(y) =$$

Let $Y = e^X$ where $X \sim \text{Bernoulli}(p)$

Probability Mass Function for Y

$$p_Y(y) = \left\{ egin{array}{ll} p & y = e \ 1 - p & y = 1 \ 0 & ext{otherwise} \end{array}
ight.$$

Expectation of $Y = e^X$

$$\sum_{y\in\{1,e\}} y\cdot p_Y(y) = (1-p)\cdot 1 + p\cdot e = 1 + p(e-1)$$

Let
$$Y = e^X$$
 where $X \sim \text{Bernoulli}(p)$

Expectation of the Function

$$\sum_{y \in \{1,e\}} y \cdot p_Y(y) = (1-p) \cdot 1 + p \cdot e = 1 + p(e-1)$$

Function of the Expectation

$$e^{E[X]}=e^p$$

$$E[g(X)] \neq g(E[X])$$

(Expected value of Function \neq Function of Expected Value)

Expectation of a Function of a Discrete RV

Let X be a random variable and g be a function. Then:

$$E[g(X)] = \sum_{\mathsf{all}\ x} g(x)p(x)$$

This is how we proceeded in the St. Petersburg Game Example

X has support
$$\{-1,0,1\}$$
, $p(-1) = p(0) = p(1) = 1/3$.

X has support
$$\{-1,0,1\}$$
, $p(-1) = p(0) = p(1) = 1/3$.

$$E[X^2] = \sum_{\text{all } x} x^2 p(x) = \sum_{x \in \{-1,0,1\}} x^2 p(x)$$

X has support
$$\{-1,0,1\}$$
, $p(-1) = p(0) = p(1) = 1/3$.

$$E[X^{2}] = \sum_{\text{all } x} x^{2} p(x) = \sum_{x \in \{-1,0,1\}} x^{2} p(x)$$
$$= (-1)^{2} \cdot (1/3) + (0)^{2} \cdot (1/3) + (1)^{2} \cdot (1/3)$$

X has support
$$\{-1,0,1\}$$
, $p(-1) = p(0) = p(1) = 1/3$.

$$E[X^{2}] = \sum_{\mathsf{all} \ x} x^{2} p(x) = \sum_{x \in \{-1,0,1\}} x^{2} p(x)$$

$$= (-1)^{2} \cdot (1/3) + (0)^{2} \cdot (1/3) + (1)^{2} \cdot (1/3)$$

$$= 1/3 + 1/3$$

$$= 2/3 \approx 0.67$$

Linearity of Expectation

Holds for Continuous RVs as well, but proof is different.

Let X be a RV and a, b be constants. Then:

$$E[a+bX]=a+bE[X]$$

This is one of the most important facts in the course: the special case in which E[g(X)] = g(E[X]) is g = a + bX.

Let $X \sim \text{Bernoulli}(1/3)$ and define Y = 3X + 2

1. What is E[X]?

Let
$$X \sim \text{Bernoulli}(1/3)$$
 and define $Y = 3X + 2$

1. What is
$$E[X]$$
? $E[X] = 0 \times 2/3 + 1 \times 1/3 = 1/3$

Let
$$X \sim \text{Bernoulli}(1/3)$$
 and define $Y = 3X + 2$

- 1. What is E[X]? $E[X] = 0 \times 2/3 + 1 \times 1/3 = 1/3$
- 2. What is E[Y]?

Let
$$X \sim \text{Bernoulli}(1/3)$$
 and define $Y = 3X + 2$

- 1. What is E[X]? $E[X] = 0 \times 2/3 + 1 \times 1/3 = 1/3$
- 2. What is E[Y]? E[Y] = E[3X + 2] = 3E[X] + 2 = 3

Proof: Linearity of Expectation For Discrete RV

$$E[a + bX] = \sum_{\text{all } x} (a + bx)p(x)$$

$$= \sum_{\text{all } x} p(x) \cdot a + \sum_{\text{all } x} p(x) \cdot bx$$

$$= a \sum_{\text{all } x} p(x) + b \sum_{\text{all } x} x \cdot p(x)$$

$$= a + bE[X]$$
